Chapter 1

1. Introduction

1.1 Project Description

*In this section, you should provide a comprehensive **overview** of your project, starting with describing its overall **purpose** and **significance**. Explain why this project is **important** and how it addresses a specific need or **problem within the field of software engineering**. Identify the **target users** or **stakeholders** who will benefit from the project and outline their needs and requirements. Clearly state the main **goals** and **objectives** of the project, detailing what you aim to achieve by the end of the development process. Lastly, specify how you will measure the success of the project, whether it's through achieving certain performance metrics, user satisfaction levels, or meeting project **deadlines**. This section sets the foundation for the rest of your project documentation, providing context and clarity on what you aim to accomplish and how you will evaluate your progress and outcomes.*

Task

*You should outline the specific **activities** and **tasks** required to accomplish the objectives of your project. Start by listing each task, ensuring that they are clear, actionable, and directly contribute to achieving the project's goals. Then, provide a brief description for each task, highlighting its significance within the **project timeline**. Explain how each task fits into the broader project plan and its role in ensuring the successful completion of the project. This section helps to break down the project into manageable components, providing a roadmap for the student to follow and ensuring that all necessary steps are identified and understood.*

Table 1 Project Timeline

Table 1 Project Timeline				
WBS	Task description	Start date	Finish date	Progress
1	Task 1 Research and Analysis	3/4/2024	3/17/2024	15%
2	Task 2 Requirements Gathering	3/18/2024	3/30/2024	25%
3	Task 3 Design and Planning	4/1/2024	4/21/2024	25%
4	Task 4 Implementation and Coding	4/23/2024	5/23/2024	35%
5	Task 5 Testing and Quality Assurance	5/24/2023	6/1/2024	10%

*The **Table.1** describes Task 1, Research and Analysis, commenced on March 4, 2024, and is scheduled to conclude on March 17, 2024, with a progress status of 15%. This task involves conducting thorough research on the specified area and analyzing existing solutions to gather essential data and insights. It plays a critical role in laying*

the groundwork for the project by providing valuable insights into the problem domain and informing subsequent decision-making processes. Task 2, Requirements Gathering, began on March 18, 2024, and is expected to finish on March 30, 2024, with a progress status of 25%. This phase involves engaging with stakeholders to collect requirements and specifications necessary for the software project. Activities such as interviews, surveys, and workshops are conducted to identify user needs and expectations accurately. Task 3, Design and Planning, started on April 1, 2024, and is set to end on April 21, 2024, with a progress status of 25%. During this phase, a comprehensive design and project plan are developed based on the gathered requirements. This includes creating system architecture, defining data models, and outlining development phases and milestones, ensuring that all team members are aligned and working towards a common goal. Task 4, Implementation and Coding, kicked off on April 23, 2024, and is slated to conclude on May 23, 2024, with a progress status of 35%. This phase involves translating the design specifications into actual code and developing the software application according to the defined requirements. It is a critical phase where attention to detail is crucial to delivering a high-quality product on time. Task 5, Testing and Quality Assurance, commenced on May 24, 2024, and is scheduled to end on June 1, 2024, with a progress status of 10%. During this phase, rigorous testing is conducted to validate the functionality, performance, and security of the developed software. This includes unit testing, integration testing, system testing, and user acceptance testing, ensuring that the final product meets quality standards and user expectations.

1.2 The Scope of the Work

To effectively provide products and services that meet your stakeholders' and users' real needs, it is necessary to identify and involve all of the stakeholders as part of the Requirements Modeling process. You must also identify the users of the system and ensure that the stakeholder community adequately represents them. This section provides a profile of the stakeholders and users involved in the project, and the key problems that they perceive to be addressed by the proposed solution. It does not describe their specific requests or requirements as these are captured in a separate stakeholder requests artifact. Instead, it provides the background and justification for why the requirements are needed.

Representative	<i>[Who is the stakeholder representative to the project? (Optional if documented elsewhere.) What we want here is names.]</i>
Description	<i>[A brief description of the stakeholder type.]</i>
Type	<i>[Qualify the stakeholder's expertise, technical background, and degree of sophistication—that is, guru, business, expert, casual user, and so on.]</i>
Responsibilities	<i>List the stakeholder's key responsibilities with regard to the system being developed that is, their interest as a stakeholder.</i>
Success Criteria	<i>[How does the stakeholder define success? How is the stakeholder rewarded?]</i>
Involvement	<i>[How is the stakeholder involved in the project? Relate where possible to Rational Unified Process roles—that is, Requirements Reviewer and so on.]</i>
Deliverables	<i>[Are there any additional deliverables required by the stakeholder? These could be project deliverables or outputs from the system under development.]</i>
Comments / Issues	<i>[Problems that interfere with success and any other relevant information go here.]</i>

1.3 Product Scenarios

Use Case Diagram: Illustrate specific product scenarios and user interactions.

Figure 1 Use Case Diagram

*This use case diagram as shown in **Figure 1** illustrates the interactions between actors (Student and Professor,) and the Graduation Project system at Zuj for a Software Engineering program. The Student submits a project proposal, which includes the optional approval by the Professor, provision of guidance by the Supervisor, and assessment of progress by the Supervisor. The Professor evaluates the project and provides feedback. Depending on the evaluation, the project may involve developing the project and, optionally, extending to submitting the final project. This diagram encapsulates the essential steps and interactions involved in the lifecycle of a graduation project, from proposal*

submission to final project submission, while also accommodating potential variations in the process.

Chapter 2

2. Requirements

2.1 Product Use Cases

List and describe individual use cases, including actors, preconditions, postconditions, and main flow.

Table 2 Submit Project Proposal Use Case

Use Case	<i>Submit Project Proposal</i>
Actor	<i>Student</i>
Preconditions	<i>The student must be logged into the Graduation Project system.</i>
Postconditions	<i>The project proposal is submitted for review</i>
Main Flow	<i>1. The student logs into the system 2. The student navigates to the project proposal submission page. 3. The student fills out the required information and submits the proposal.</i>

2.2 Functional Requirements

Specify the functional capabilities and features of the software. Describe each requirement in detail, including its purpose and acceptance criteria.

2.2.1 User Authentication

Description: Users should be able to create accounts and log in securely.

Purpose: This feature ensures that only authorized users can access the system, maintaining data security and privacy.

- Acceptance Criteria:
 - 1) Users can register for an account by providing necessary information such as username, email, and password.
 - 2) Registered users can log in using their credentials.
 - 3) Passwords are securely hashed and stored in the database.

2.3 Data Requirements

Identify the types of data the system will handle. Define data entities, attributes, relationships, and constraints.

Specify data storage and retrieval mechanisms.

2.3.1 Submit Project Proposal

Types of Data:

- I. Student data: Information about the student submitting the proposal.
- II. Project proposal data: Details about the proposed project, including title, description, objectives, methodology, resources required, and timeline.
- III. Supporting documents: Any additional files or documents attached to the proposal.

Data Entities:

- I. Student: Represents a student user of the system.
- II. Project Proposal: Represents the proposal submitted by the student.
- III. Supporting Document: Represents any additional files or documents attached to the proposal.

Attributes:

- I. Student:
 - 1) Name
 - 2) Student ID
 - 3) Email
 - 4) Department
- II. Project Proposal:
 - 1) Title
 - 2) Description
 - 3) Objectives
 - 4) Methodology
 - 5) Resources required
 - 6) Timeline
 - 7) Status
 - 8) Submission date
- III. Supporting Document:
 - 1) File name
 - 2) File type
 - 3) File size
 - 4) Upload date

Constraints

- 1) Unique Student ID: Each student should have a unique identifier.
- 2) Required Proposal Fields: Certain fields in the project proposal form may be mandatory, such as title, description, and objectives.
- 3) File Size Limit: There may be a constraint on the maximum size of supporting documents that can be uploaded.
- 4) Submission Deadline: A deadline constraint may be imposed for submitting project proposals.

Figure 2 Database Schema

Chapter 3

3. Design

3.1 System Design

Define the high-level design goals and principles. Create a component diagram showing the major components of the system and their interactions.

Figure 3 component diagram for the Submit Project Proposal

3.2 Proposed Software Architecture

Provide an overview of the software architecture, including layers, components, and their interactions. Create class diagrams showing the static structure of the system. Develop sequence diagrams illustrating dynamic interactions between objects or components.

Figure 4 class diagram.

In this class diagram, UserInterface represents the user interface component with methods for displaying the proposal form, submitting proposals, and receiving confirmation messages. ProposalService represents the service component responsible for processing proposals and storing proposal data. Database represents the data access component with methods for saving and retrieving data.

Figure 5 Sequence Diagram

The figure above presents the sequence diagram for

UserInterface initiates the proposal submission process by calling the `submitProposal()` method. ProposalService receives the submission request and calls the `storeProposalData()` method to store the proposal data in the database. The Database component stores the data and sends a confirmation message back to the ProposalService. Finally, the ProposalService sends the confirmation message to the UserInterface.

3.3 User Interface

Design the graphical user interface (GUI) to be intuitive and user-friendly. Create wireframe diagrams or mockups to visualize the layout and design of the interface.

3.4 Object Design

Define the objects and their attributes and methods. Specify how objects interact with each other and with the system.

Chapter 4

4. Test Plans

4.1 Approach

Describe the overall approach to testing, including the types of tests to be conducted.

Specify testing materials and resources required.

Define criteria for suspending and resuming testing activities.

4.2 Test Cases

Create individual test cases for each functional requirement or use case.

Specify input data, expected outcomes, and pass/fail criteria for each test case.

Organize test cases into a test suite for efficient execution and management.

This comprehensive outline should guide you through the process of creating a detailed project plan for your Bachelor's software engineering project, ensuring that all relevant aspects are covered effectively.

Scope

*[A brief description of the scope of this **Vision** document; what Project(s) it is associated with and anything else that is affected or influenced by this document.]*

4.3 Definitions, Acronyms, and Abbreviations

*[This subsection provides the definitions of all terms, acronyms, and abbreviations required to properly interpret the **Vision** document. This information may be provided by reference to the project's Glossary.]*

4.4 References

*[This subsection provides a complete list of all documents referenced elsewhere in the **Vision** document. Identify each document by title, report number if applicable, date, and publishing organization. Specify the sources from which the references can be obtained. This information may be provided by reference to an appendix or to another document.]*

4.5 Overview

*[This subsection describes what the rest of the **Vision** document contains and explains how the document is*

organized.]

5. Positioning

5.1 Business Opportunity

[Briefly describe the business opportunity being met by this project.]

5.2 Problem Statement

[Provide a statement summarizing the problem being solved by this project. The following format may be used:]

The problem of	<i>[describe the problem]</i>
affects	<i>[the stakeholders affected by the problem]</i>
the impact of which is	<i>[what is the impact of the problem?]</i>
a successful solution would be	<i>[list some key benefits of a successful solution]</i>

5.3 Product Position Statement

[Provide an overall statement summarizing, at the highest level, the unique position the product intends to fill in the marketplace. The following format may be used:]

For	<i>[target customer]</i>
Who	<i>[statement of the need or opportunity]</i>
The (product name)	<i>is a [product category]</i>
That	<i>[statement of key benefit; that is, the compelling reason to buy]</i>
Unlike	<i>[primary competitive alternative]</i>
Our product	<i>[statement of primary differentiation]</i>

[A product position statement communicates the intent of the application and the importance of the project to all concerned personnel.]

6. Stakeholder and User Descriptions

[To effectively provide products and services that meet your stakeholders' and users' real needs, it is necessary to identify and involve all of the stakeholders as part of the Requirements Modeling process. You must also identify the users of the system and ensure that the stakeholder community adequately represents them. This section provides a profile of the stakeholders and users involved in the project, and the key problems that they perceive to be addressed by the proposed solution. It does not describe their specific requests or requirements as these are captured in a separate stakeholder requests artifact. Instead, it provides the background and justification for why the requirements are needed.]

6.1 Market Demographics

[Summarize the key market demographics that motivate your product decisions. Describe and position target market segments. Estimate the market's size and growth by using the number of potential users or the amount of money your customers spend trying to meet needs that your product or enhancement would fulfill. Review major industry trends and technologies. Answer these strategic questions:]

- What is your organization's reputation in these markets?*
- What would you like it to be?*
- How does this product or service support your goals?]*

6.2 Stakeholder Summary

[There are a number of stakeholders with an interest in the development and not all of them are end users. Present a summary list of these non-user stakeholders. (The users are summarized in section 3.3.)]

Name	Description	Responsibilities
<i>[Name the stakeholder type.]</i>	<i>[Briefly describe the stakeholder.]</i>	<i>[Summarize the stakeholder's key responsibilities with regard to the system being developed; that is, their interest as a stakeholder. For example, this stakeholder:</i> <i>- ensures that the system will be maintainable</i> <i>- ensures that there will be a market demand for the product's features</i> <i>- monitors the project's progress</i> <i>- approves funding</i> <i>- and so forth]</i>

6.3 User Summary

[Present a summary list of all identified users.]

Name	Description	Responsibilities	Stakeholder
<i>[Name the user type.]</i>	<i>[Briefly describe what they represent with respect to the system.]</i>	<i>[List the user's key responsibilities with regard to the system being developed; for example:</i> <i>- captures details</i> <i>- produces reports</i> <i>- coordinates work</i> <i>- and so on]</i>	<i>[If the user is not directly represented, identify which stakeholder is responsible for representing the user's interest.]</i>

6.4 User Environment

[Detail the working environment of the target user. Here are some suggestions:

- Number of people involved in completing the task? Is this changing?*
- How long is a task cycle? Amount of time spent in each activity? Is this changing?*
- Any unique environmental constraints: mobile, outdoors, in-flight, and so on?*
- Which systems platforms are in use today? Future platforms?*
- What other applications are in use? Does your application need to integrate with them?*

This is where extracts from the Business Model could be included to outline the task and roles involved and so on.]

6.5 Stakeholder Profiles

[Describe each stakeholder in the system here by filling in the following table for each stakeholder. Remember that stakeholder types can be as divergent as users, departments, and technical developers. A thorough profile would cover the following topics for each type of stakeholder.]

6.5.1 <Stakeholder Name>

Representative	<i>[Who is the stakeholder representative to the project? (Optional if documented elsewhere.) What we want here is names.]</i>
Description	<i>[A brief description of the stakeholder type.]</i>
Type	<i>[Qualify the stakeholder's expertise, technical background, and degree of sophistication—that is, guru, business, expert, casual user, and so on.]</i>
Responsibilities	<i>[List the stakeholder's key responsibilities with regard to the system being developed—that is, their interest as a stakeholder.]</i>
Success Criteria	<i>[How does the stakeholder define success? How is the stakeholder rewarded?]</i>
Involvement	<i>[How is the stakeholder involved in the project? Relate where possible to Rational Unified Process roles—that is, Requirements Reviewer and so on.]</i>
Deliverables	<i>[Are there any additional deliverables required by the stakeholder? These could be project deliverables or outputs from the system under development.]</i>
Comments / Issues	<i>[Problems that interfere with success and any other relevant information go here.]</i>

6.6 User Profiles

[Describe each unique user of the system here by filling in the following table for each user type. Remember user types can be as divergent as gurus and novices. For example, a guru might need a sophisticated, flexible tool with cross-platform support, while a novice might need a tool that is easy to use and user-friendly. A thorough profile needs to cover the following topics for each type of user.]

6.6.1 <User Name>

Representative	<i>[Who is the user representative to the project? (Optional if documented elsewhere.) This often refers to the Stakeholder that represents the set of users, for example, Stakeholder1.]</i>
Description	<i>[A brief description of the user type.]</i>
Type	<i>[Qualify the user's expertise, technical background, and degree of sophistication—that is, guru, casual user, and so on.]</i>
Responsibilities	<i>[List the user's key responsibilities with regard to the system being developed—that is, captures details, produces reports, coordinates work, and so forth.]</i>
Success Criteria	<i>[How does the user define success? How is the user rewarded?]</i>
Involvement	<i>[How is the user involved in the project? Relate where possible to Rational Unified Process roles—that is, Requirements Reviewer, and so on.]</i>
Deliverables	<i>[Are there any deliverables the user produces and, if so, for whom?]</i>
Comments / Issues	<i>[Problems that interfere with success and any other relevant information go here. These would include trends that make the user's job easier or harder.]</i>

6.7 Key Stakeholder or User Needs

[List the key problems with existing solutions as perceived by the stakeholder or user. Clarify the following issues for each problem:

- What are the reasons for this problem?*
- How is it solved now?*
- What solutions does the stakeholder or user want?]*

*[It is important to understand the **relative** importance the stakeholder or user places on solving each problem. Ranking and cumulative voting techniques indicate problems that **must** be solved versus issues they would like addressed.*

Fill in the following table—if using Rational RequisitePro to capture the Needs, this could be an extract or report from that tool.]

Need	Priority	Concerns	Current Solution	Proposed Solutions
Broadcast messages				

6.8 Alternatives and Competition

[Identify alternatives the stakeholder perceives as available. These can include buying a competitor's product, building a homegrown solution or simply maintaining the status quo. List any known competitive choices that exist or may become available. Include the major strengths and weaknesses of each competitor as perceived by the stakeholder or end user.]

6.8.1 <aCompetitor>

6.8.2 <anotherCompetitor>

7. Product Overview

[This section provides a high level view of the product capabilities, interfaces to other applications, and system configurations. This section usually consists of three subsections, as follows:

- Product perspective*
- Product functions*
- Assumptions and dependencies]*

7.1 Product Perspective

*[This subsection of the **Vision** document puts the product in perspective to other related products and the user's environment. If the product is independent and totally self-contained, state it here. If the product is a component of a larger system, then this subsection needs to relate how these systems interact and needs to identify the relevant interfaces between the systems. One easy way to display the major components of the larger system, interconnections, and external interfaces is with a block diagram.]*

7.2 Summary of Capabilities

*[Summarize the major benefits and features the product will provide. For example, a **Vision** document for a customer support system may use this part to address problem documentation, routing, and status reporting without mentioning the amount of detail each of these functions requires.*

Organize the functions so the list is understandable to the customer or to anyone else reading the document for the first time. A simple table listing the key benefits and their supporting features might suffice. For example:]

Table 4-1 Customer Support System

Customer Benefit	Supporting Features
New support staff can quickly get up to speed.	Knowledge base assists support personnel in quickly identifying known fixes and workarounds.
Customer satisfaction is improved because nothing falls through the cracks.	Problems are uniquely itemized, classified and tracked throughout the resolution process. Automatic notification occurs for any aging issues.
Management can identify problem areas and gauge staff workload.	Trend and distribution reports allow high level review of problem status.
Distributed support teams can work together to solve problems.	Replication server allows current database information to be shared across the enterprise.
Customers can help themselves, lowering support costs and improving response time.	Knowledge base can be made available over the Internet. Includes hypertext search capabilities and graphical query engine.

7.3 Assumptions and Dependencies

*[List each of the factors that affect the features stated in the **Vision** document. List assumptions that, if changed, will alter the **Vision** document. For example, an assumption may state that a specific operating system will be available for the hardware designated for the software product. If the operating system is not available, the **Vision** document will need to change.]*

7.4 Cost and Pricing

[For products sold to external customers and for many in-house applications, cost and pricing issues can directly impact the application's definition and implementation. In this section, record any cost and pricing constraints that are relevant. For example, distribution costs, (# of diskettes, # of CD-ROMs, CD mastering) or other cost of goods sold constraints (manuals, packaging) may be material to the projects success, or irrelevant, depending on the nature of the application.]

7.5 Licensing and Installation

[Licensing and installation issues can also directly impact the development effort. For example, the need to support serializing, password security or network licensing will create additional requirements of the system that must be considered in the development effort.]

Installation requirements may also affect coding or create the need for separate installation software.]

8. Product Features

[List and briefly describe the product features. Features are the high-level capabilities of the system that are necessary to deliver benefits to the users. Each feature is an externally desired service that typically requires a series of inputs to achieve the desired result. For example, a feature of a problem tracking system might be the ability to provide trending reports. As the use-case model takes shape, update the description to refer to the use cases.]

*Because the **Vision** document is reviewed by a wide variety of involved personnel, the level of detail needs to be general enough for everyone to understand. However, enough detail must be available to provide the team with the information they need to create a use-case model.*

To effectively manage application complexity, we recommend for any new system, or an increment to an existing system, capabilities are abstracted to a high enough level so 25-99 features result. These features provide the fundamental basis for product definition, scope management, and project management. Each feature will be expanded in greater detail in the use-case model.

Throughout this section, each feature will be externally perceivable by users, operators or other external systems. These features need to include a description of functionality and any relevant usability issues that must be addressed. The following guidelines apply:

- Avoid design. Keep feature descriptions at a general level. Focus on capabilities needed and why (not how) they should be implemented.*
- If you are using the Rational RequisitePro toolkit, all need to be selected as requirements of type for easy reference and tracking.]*

8.1 <aFeature>

8.2 <anotherFeature>

9. Constraints

[Note any design constraints, external constraints or other dependencies.]

10. Quality Ranges

[Define the quality ranges for performance, robustness, fault tolerance, usability, and similar characteristics that are not captured in the Feature Set.]

11. Precedence and Priority

[Define the priority of the different system features.]

12. Other Product Requirements

[At a high level, list applicable standards, hardware or platform requirements, performance requirements, and environmental requirements.]

12.1 Applicable Standards

[List all standards with which the product must comply. These can include legal and regulatory (FDA, UCC) communications standards (TCP/IP, ISDN), platform compliance standards (Windows, UNIX, and so on), and quality and safety standards (UL, ISO, CMM).]

12.2 System Requirements

[Define any system requirements necessary to support the application. These can include the supported host operating systems and network platforms, configurations, memory, peripherals, and companion software.]

12.3 Performance Requirements

[Use this section to detail performance requirements. Performance issues can include such items as user load factors, bandwidth or communication capacity, throughput, accuracy, and reliability or response times under a variety of loading conditions.]

12.4 Environmental Requirements

[Detail environmental requirements as needed. For hardware- based systems, environmental issues can include temperature, shock, humidity, radiation, and so forth. For software applications, environmental factors can include usage conditions, user environment, resource availability, maintenance issues, and error handling and recovery.]

13. Documentation Requirements

[This section describes the documentation that must be developed to support successful application deployment.]

13.1 User Manual

[Describe the purpose and contents of the User Manual. Discuss desired length, level of detail, need for index, glossary of terms, tutorial versus reference manual strategy, and so on. Formatting and printing constraints must also be identified.]

13.2 Online Help

[Many applications provide an online help system to assist the user. The nature of these systems is unique to application development as they combine aspects of programming (hyperlinks, and so forth) with aspects of technical writing, such as organization and presentation. Many have found the development of an online help system is a project within a project that benefits from up-front scope management and planning activity.]

13.3 Installation Guides, Configuration, and Read Me File

[A document that includes installation instructions and configuration guidelines is important to a full solution offering. Also, a Read Me file is typically included as a standard component. The Read Me file can include a "What's New With This Release" section, and a discussion of compatibility issues with earlier releases. Most users also appreciate documentation defining any known bugs and workarounds in the Read Me file.]

13.4 Labeling and Packaging

[Today's state-of-the-art applications provide a consistent look and feel that begins with product packaging and manifests through installation menus, splash screens, help systems, GUI dialogs, and so on. This section defines the needs and types of labeling to be incorporated into the code. Examples include copyright and patent notices, corporate logos, standardized icons and other graphic elements, and so forth.]

A Feature Attributes

[Features are given attributes that can be used to evaluate, track, prioritize, and manage the product items proposed for implementation. All requirement types and attributes need to be outlined in the Requirements Management Plan, however, you may wish to list and briefly describe the attributes for features that have been chosen. The following subsections represent a set of suggested feature attributes.]

A.1 Status

[Set after negotiation and review by the project management team. Tracks progress during definition of the project baseline.]

Proposed	<i>[Used to describe features that are under discussion but have not yet been reviewed and accepted by the "official channel," such as a working group consisting of representatives from the project team, product management, and user or customer community.]</i>
Approved	<i>[Capabilities that are deemed useful and feasible, and have been approved for implementation by the official channel.]</i>
Incorporated	<i>[Features incorporated into the product baseline at a specific point in time.]</i>

A.2 Benefit

[Set by Marketing, the product manager or the business analyst. All requirements are not created equal. Ranking requirements by their relative benefit to the end user opens a dialog with customers, analysts, and members of the development team. Used in managing scope and determining development priority.]

Critical	<i>[Essential features. Failure to implement means the system will not meet customer needs. All critical features must be implemented in the release or the schedule will slip.]</i>
Important	<i>[Features important to the effectiveness and efficiency of the system for most applications. The functionality cannot be easily provided in some other way. Lack of inclusion of an important feature may affect customer or user satisfaction, or even revenue, but release will not be delayed due to lack of any important feature.]</i>
Useful	<i>[Features that are useful in less typical applications will be used less frequently or for which reasonably efficient workarounds can be achieved. No significant revenue or customer satisfaction impact can be expected if such an item is not included in a release.]</i>

A.3 Effort

[Set by the development team. Because some features require more time and resources than others, estimating the number of team or person-weeks, lines of code required or function points, for example, is the best way to gauge complexity and set expectations of what can and cannot be accomplished in a given time frame. Used in managing scope and determining development priority.]

A.4 Risk

[Set by development team based on the probability the project will experience undesirable events, such as cost overruns, schedule delays or even cancellation. Most project managers find categorizing risks, as high, medium, and low, is sufficient, although finer gradations are possible. Risk can often be indirectly assessed by measuring the uncertainty (range) of the projects team's schedule estimate.]

A.5 Stability

[Set by the analyst and development team, this is based on the probability that features will change or the team's understanding of the feature will change. Used to help establish development priorities and determine those items for which additional elicitation is the appropriate next action.]

A.6 Target Release

*[Records the intended product version in which the feature will first appear. This field can be used to allocate features from a **Vision** document into a particular baseline release. When combined with the status field, your team can propose, record, and discuss various features of the release without committing them to development. Only features whose Status is set to Incorporated and whose Target Release is defined will be implemented. When scope management occurs, the Target Release Version Number can be increased so the item will remain in the **Vision** document but will be scheduled for a later release.]*

A.7 Assigned To

[In many projects, features will be assigned to "feature teams" responsible for further elicitation, writing the software requirements, and implementation. This simple pull-down list will help everyone on the project team to understand responsibilities better.]

A.8 Reason

[This text field is used to track the source of the requested feature. Requirements exist for specific reasons. This field records an explanation or a reference to an explanation. For example, the reference might be to a page and line number of a product requirement specification or to a minute marker on a video of an important customer review.]
